

Stainless Steel Heating Element

INDEPENDENT INSTALLATION

EV water heaters are ideal for obtaining hot water in places not connected to a centralised system. All you need is a cold water supply and an electrical socket to easily install the appliance. This appliance is particularly suitable for small apartments, utility rooms, the work-place, camper vans etc. EV models are available in 10, 15 and 30 litre sizes and so when installed independently allow 2 simultaneous usages (about 30 litres). EV can also be used as part of an open outlet tap group.

INSTALLATION IN-LINE AS PART OF A SYSTEM

EV models can be installed as part of a medium sized or large centralised system, in this case water can be heated to the maximum temperature, e.g. 60 °C, only at the point of use and the main reserve of hot water can be kept at a medium temperature, e.g. 40°C. With this kind of system you get the best quality of service with a high level of energy saving.

The number of simultaneous usages is strictly related to the number of appliances installed and the size of the central water heater.
